

## Multicenter Trial of a Tubeless, On-Body Automated Insulin Delivery System With Customizable Glycaemic Targets in Paediatric and Adult Participants With Type 1 Diabetes

- **Clinical objective:** to evaluate the safety and efficacy of the Omnipod<sup>®</sup> 5 Automated Insulin Delivery (AID) System, the first tubeless, on-body AID system with customizable glycaemic targets.
- **Primary end points** were change in HbA1c at the end of the AID phase compared with baseline and Time in Range 70–180 mg/dL (3.9-10.0 mmol/L) during the AID phase compared with the Standard Therapy (ST) phase. Primary safety outcomes were incidence of severe hypoglycaemia and diabetic ketoacidosis (DKA).
- Secondary end points included percent time with glucose levels <70 mg/dL (<3.9 mmol/L),</li>
   >180 mg/dL (>10.0 mmol/L) and <54 mg/dL (<3.0 mmol/L) during the AID phase compared with the ST phase.</li>
- **Significant improvements** in HbA1c and glycaemic measures, with a low rate of hypoglycaemia in a heterogeneous participant group with varied age, baseline glycaemia and prior insulin delivery regimen.

Study Design	Study Participants
<ul> <li>Prospective, multicenter, single-arm outpatient study: <ul> <li>14-day standard therapy phase</li> <li>3-month AID phase with Omnipod 5 system</li> </ul> </li> <li>240 children, adolescents and adults enrolled at 17 institutions across the US</li> <li>User-selected target glucose ranges from 110-150 mg/dL (6.1-8.3 mmol/L)</li> <li>Unrestricted diet and exercise throughout</li> </ul>	<ul> <li>112 Children: Age 6 to &lt;14 years</li> <li>128 Adolescents and Adults: Age 14 to 70 years</li> <li>All participants: <ul> <li>Type 1 diabetes for ≥6 months</li> <li>HbA1c &lt;10.0% (&lt;86 mmol/mol)</li> <li>Any prior insulin therapy (MDI or CSII)</li> </ul> </li> </ul>

### **Omnipod 5 System reduced HbA1c**

## HbA1c is reduced by 0.38% (4.2 mmol/mol) in Adolescents and Adults<sup>1</sup>

🔴 Standard Therapy phase 🛛 🔵 Omnipod 5 System phase

\* p<0.0001; † p=0.046. Baseline and follow-up data were used for the HbA1c primary endpoint. Data shown for Standard Therapy phase and AID phase.

Data shown as mean HbA1c.

MDI, multiple daily injections with insulin.

#### HbA1c is reduced by 0.71% (7.8 mmol/mol) in Children<sup>1</sup>

Standard Therapy phase Omnipod 5 System phase

\* p<0.0001; † p<0.0005. Baseline and follow-up data were used for the HbA1c primary endpoint. Data shown for Standard Therapy phase and AID phase.

Data shown as mean HbA1c.

MDI, multiple daily injections with insulin.

## Omnipod 5 System increased Time in Range (TIR)

- TIR is improved by 2.2 hours/day (9.3%) in Adolescents and Adults<sup>1</sup>
- TIR is improved by 3.7 hours/day (15.6%) in Children<sup>1</sup>

Children spent median 96.4% and adults/ adolescents spent median 96.7% of total study time in automated mode.

🛑 Standard Therapy phase 🛛 🌑 Omnipod 5 System phase

\* p<0.0001. Data shown as mean %TIR

# Reduced hypoglycaemia in adolescents and adults, with low remaining hypoglycaemia in children

- Hypoglycaemia is reduced by 46% in Adolescents and Adults<sup>1</sup>
- Hypoglycaemia remains low in children

<sup>🔴</sup> Standard Therapy phase 🛛 🔵 Omnipod 5 System phase

\* p<0.0001. Data shown as median %Time Below Ranges <70 mg/dL and <54 mg/dL  $\,$ 

## Study Highlights:1

#### **Reduced HbA1c**

- Omnipod 5 System lowered HbA1c by 0.38% (4.2 mmol/mol) in Adolescents/Adults, and by 0.71% (7.8 mmol/mol) in Children
- 66% of Adults/Adolescents and 53% of Children achieved the ADA recommended HbA1c target of <7.0% (<53 mmol/mol)

#### Increased Time in Range (TIR)

- Improved TIR by 2.2 hours/day (9.3%) in in Adolescents/Adults, and by 3.7 hours/day (15.6%) in Children
- 82% of Children and 69% of Adults/Adolescents met consensus clinical targets for TIR
- All age groups demonstrated 78% TIR overnight from 00:00–06:00 h during the study

#### Low time in hypoglycaemia

- Omnipod 5 System reduced time in hypoglycaemia by 46% in Adults and Adolescents, including a 60% reduction in nocturnal hypoglycaemia (00:00–06:00 h)
- Time in hypoglycaemia remained low throughout the study in Children

#### System use

- Children spent median 96.4% and Adults/Adolescents spent median 96.7% of total study time in automated mode
- Incidence of severe hypoglycaemia and DKA were below reported rates in the US T1D Exchange Registry and were not attributable to AID malfunction
